

# Introduction to Databases

# Agenda

- What are data and metadata?
- What is a database?
- What is a database management system (DBMS)?
- What kinds of DBMS are out there?
- How are databases perceived?
- How do we build database applications?

Introduction to Databases

The End

# The Database Defined and Data

# The Database Defined

# Data

- Raw, unprocessed facts
- Three types
  1. Atomic: simple
  2. Composite: consists of more than one value
  3. Rule: identifies how data are related

# Data Are Raw and Unprocessed

## Facts

Atomic  
\$45  
13244

## Objects

Composite  
314 Hinds Hall Syracuse, NY  
<https://www.syr.edu/ischool>

## Processes/rules

Connects objects  
Customer pays invoice  
Car consists of parts

The Database Defined and Data  
The End

# Information Defined

# Information

- Information is contextualized data; any data within a context
- The output of a process
- Processed data
- Examples
  - $2 + 3 = 5$ 
    - 2 and 3 are data, 5 is information within the addition context.
  - Because Bob's date of birth is 11/1/1990, on November 1, 2020, Bob will be 30 years old
    - 30 years old is information, the output of a process.

# Information Is Data in Context

- Example, a function call in code:  
`getStudentGrade('mafudge', 'IST256', 'Fall 2020')`
- Input data: 'mafudge', 'IST256', 'Fall 2020'
- Process: `getStudentGrade`
- Output information: A-

# Data, Process, Information

You

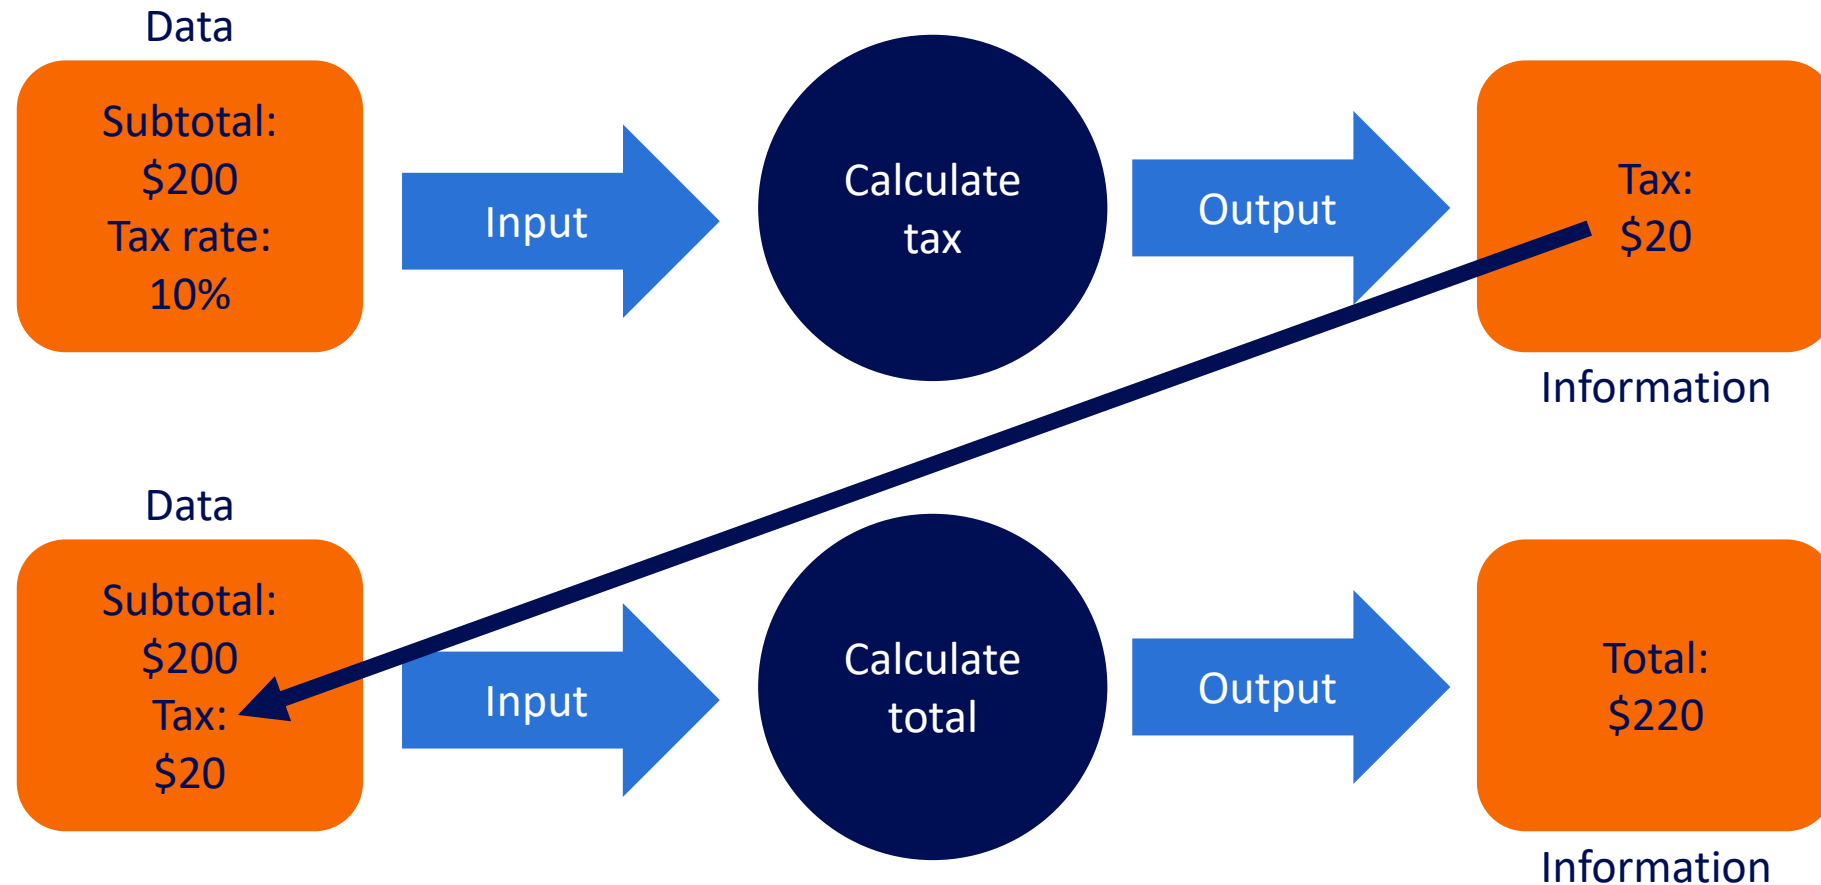

Data:  
Alexa, what is the  
current  
temperature in  
Syracuse, New  
York?

Information:  
The current  
temperature in  
Syracuse, New York,  
is 46 degrees  
Fahrenheit.

Alexa

# Data Can Be Information; Information Can Be Data

Information Defined

The End

# Metadata Defined

# Metadata

- Metadata is data about data
- It is used to describe and add additional meaning to data
- Examples
  - 3.75 is just data. But GPA is 3.75; the “GPA” labels the data. GPA is metadata.
  - Dec-2021 is just data. With date metadata, we know this is a month and year.
  - 3155551234 is just data. With structural metadata, (315) 555-1234 is a phone number.

# Metadata: Data About Data

## Different types

- Label: visual descriptor; amount of money I have → \$5
- Definition: provides a definition; money is a quantity of legal tender → \$5
- Type: valid data type; numeric → \$5
- Constraints: business rules or acceptable values; must be 0 or more → \$5
- Length: storage format; 12 bytes → \$5
- Location: where the data can exist; my wallet → \$5
- Ownership: who or what has access; my wallet → \$5

Metadata Defined

The End

# Data Management

# Data Management

- The process of storing, retrieving, and maintaining data
- Metadata helps by defining a storage format, access rules, and maintaining data integrity
- Four data management operations...

# Computers Are Built for Data Management

# Let's Revisit the Database Definition

Data Management

The End

# Database Management System (DBMS)

# Database Management System

Software suited to the task of  
database management

# Common Features of the DBMS

Metadata implementation

Data management

Query language

Data independence

Concurrency control

Data security

Backup and recovery management

Database Management  
System (DBMS)

The End

# DBMS Implementation Models

# DBMS Implementation Data Models

- An implementation data model
  - Governs how the data are structured and stored within the database itself
  - Determines the design philosophy, capabilities, and limitations
- No one model is better than the other
- Each has its use cases and common applications

# Popular Implementation Models

		Name	Description	Use cases
NoSQL	{	Relational	Data are stored in structured tables of rows with metadata defining the columns; metadata defines how data in tables connect to one another	Business applications, multiuse
		Key value	Data are stored under a key; information can be retrieved by key; little to no metadata	Caching, session management, real-time data
		Document	Structured metadata is stored with data in a document; like documents are stored in collections	Content management, master data, search engines
		Graph	Data are structured into nodes, edges, and labels; permits for complex relationships among data	Hierarchical data, networked data, social networks
		Column-oriented	Tabular data structure with data in columns and metadata in the row, a computationally efficient structure for data analytics	Internet of things data, data analytics, data warehousing
		Time series	Tabular data structure in time-order; data are immutable and support high-volume writes	Internet of things, time-oriented analysis, and forecasting

DBMS Implementation Models

The End

# Database Application Development

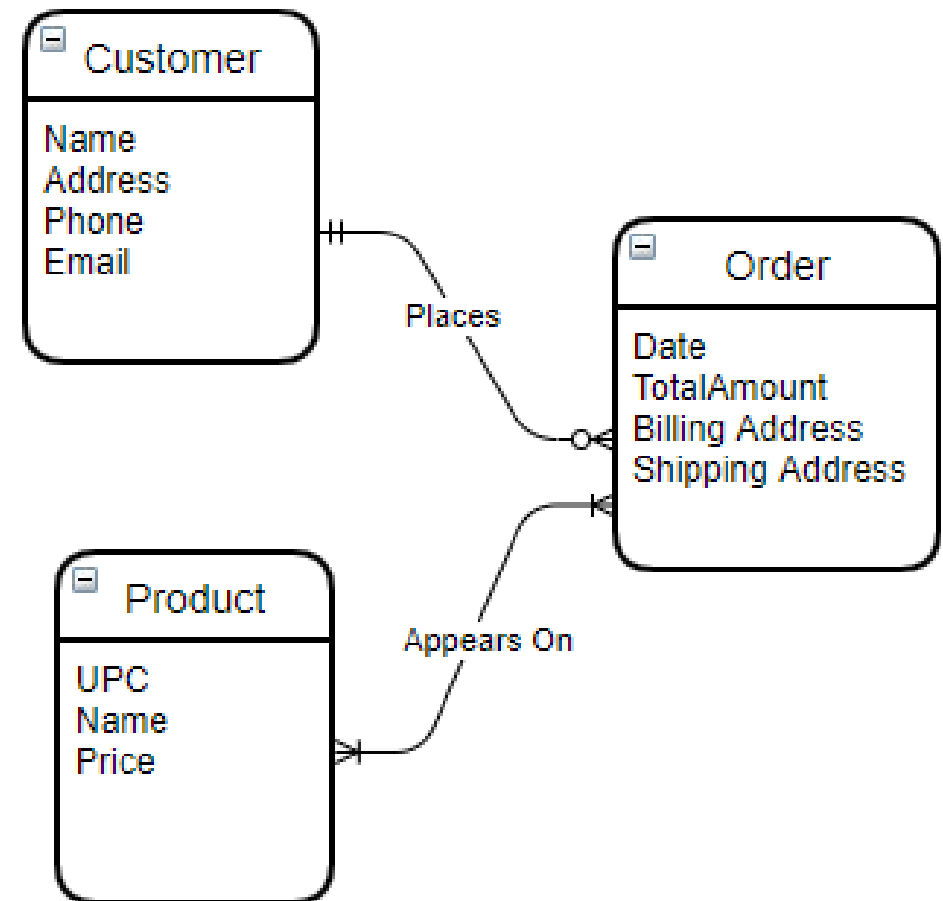

# Database Application Development

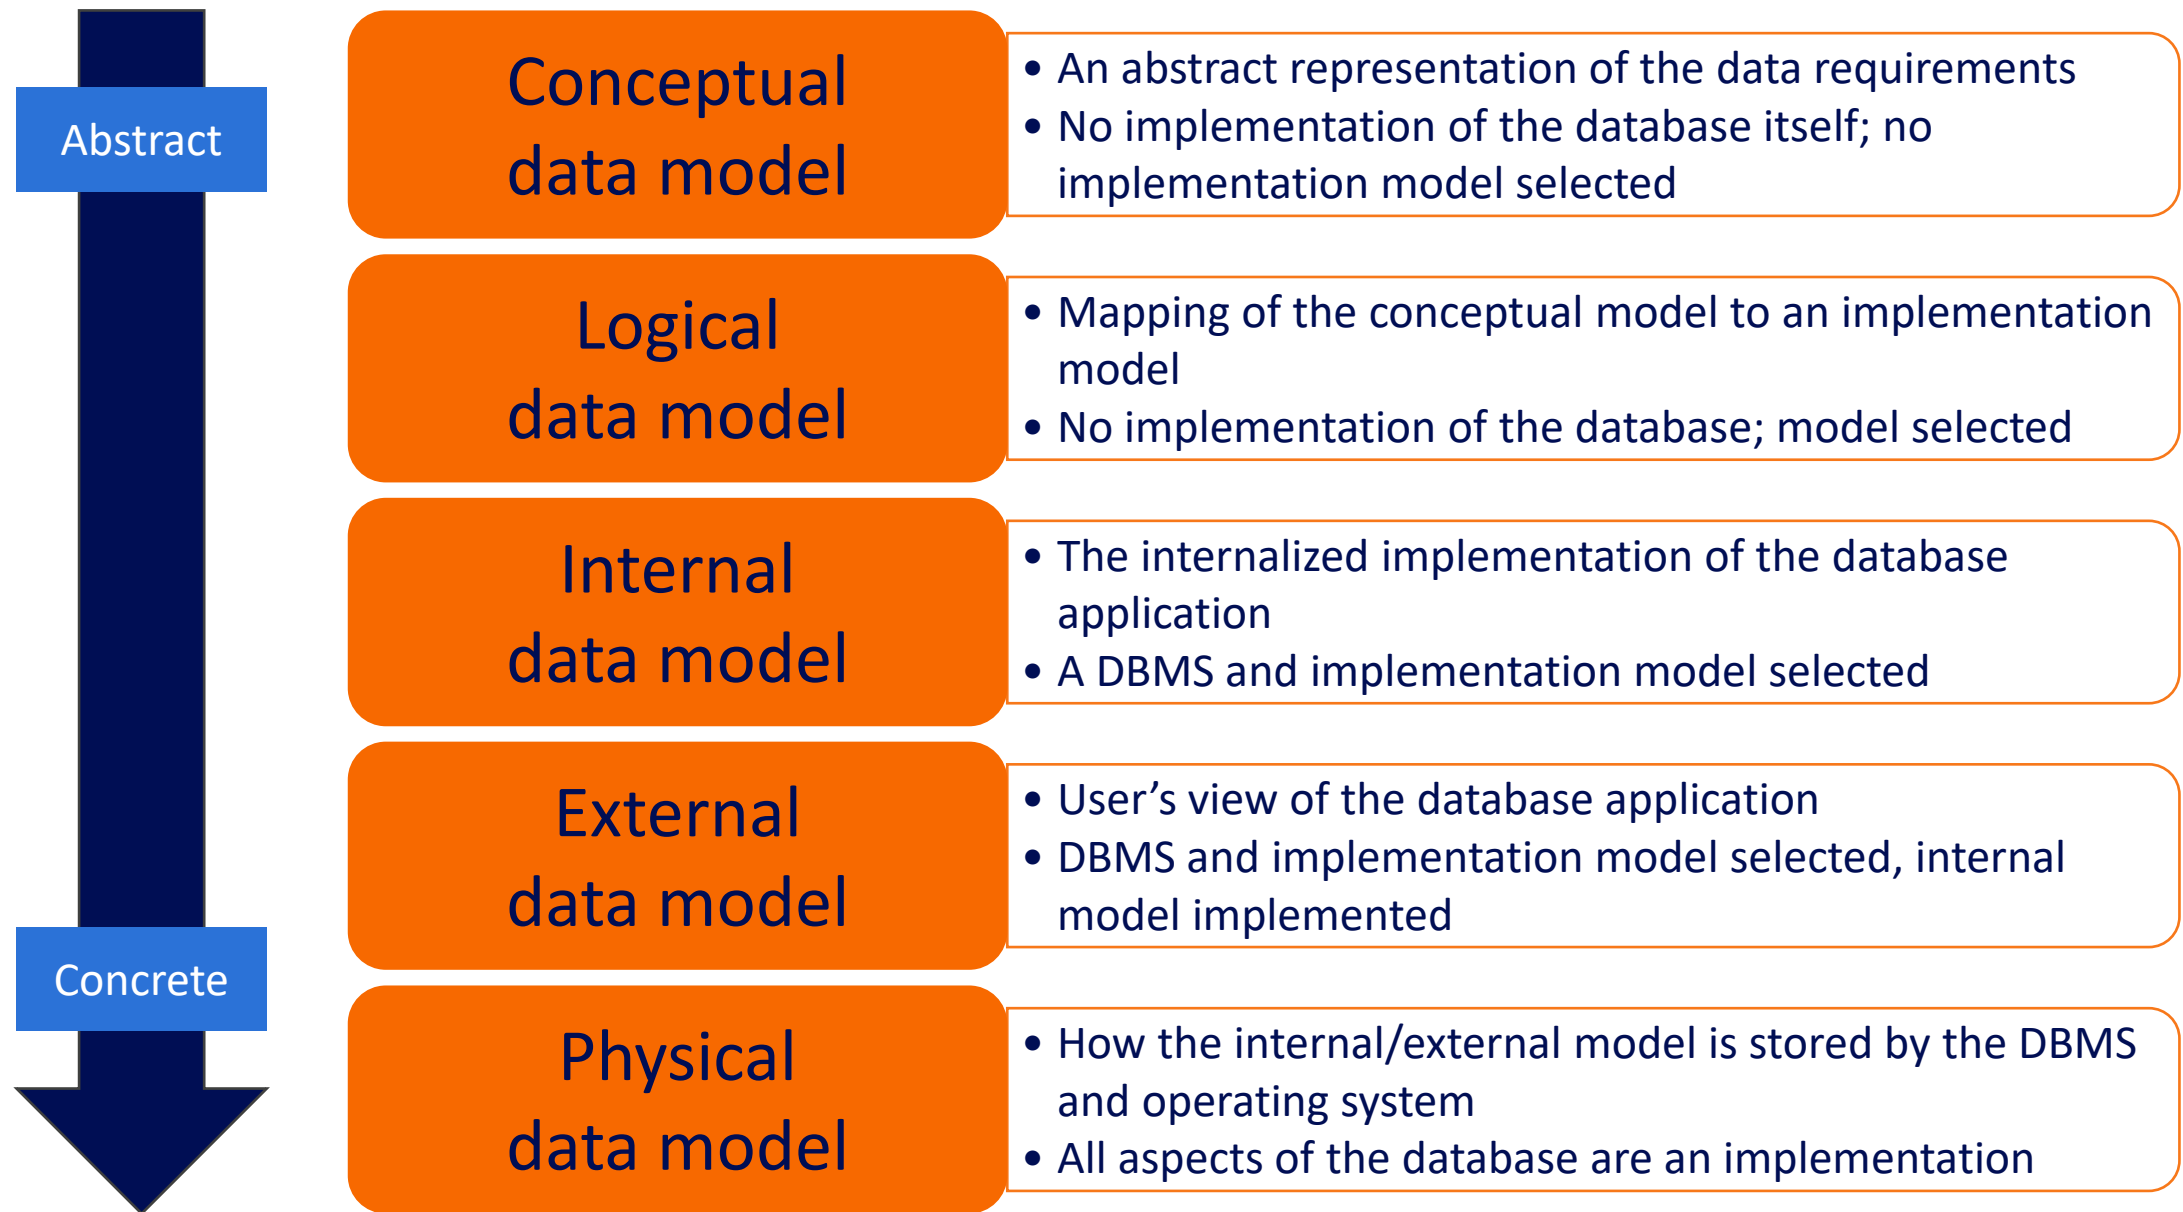

- All applications have data!
- Using a DBMS makes developing a database-driven application easier
- Since the DBMS trivializes data and metadata management
- But it starts with a good design
- In this course, we will learn design principles for creating database applications as well as database development

# Data Models

- Various degrees of abstraction of the same database
- Important when within the context of database development

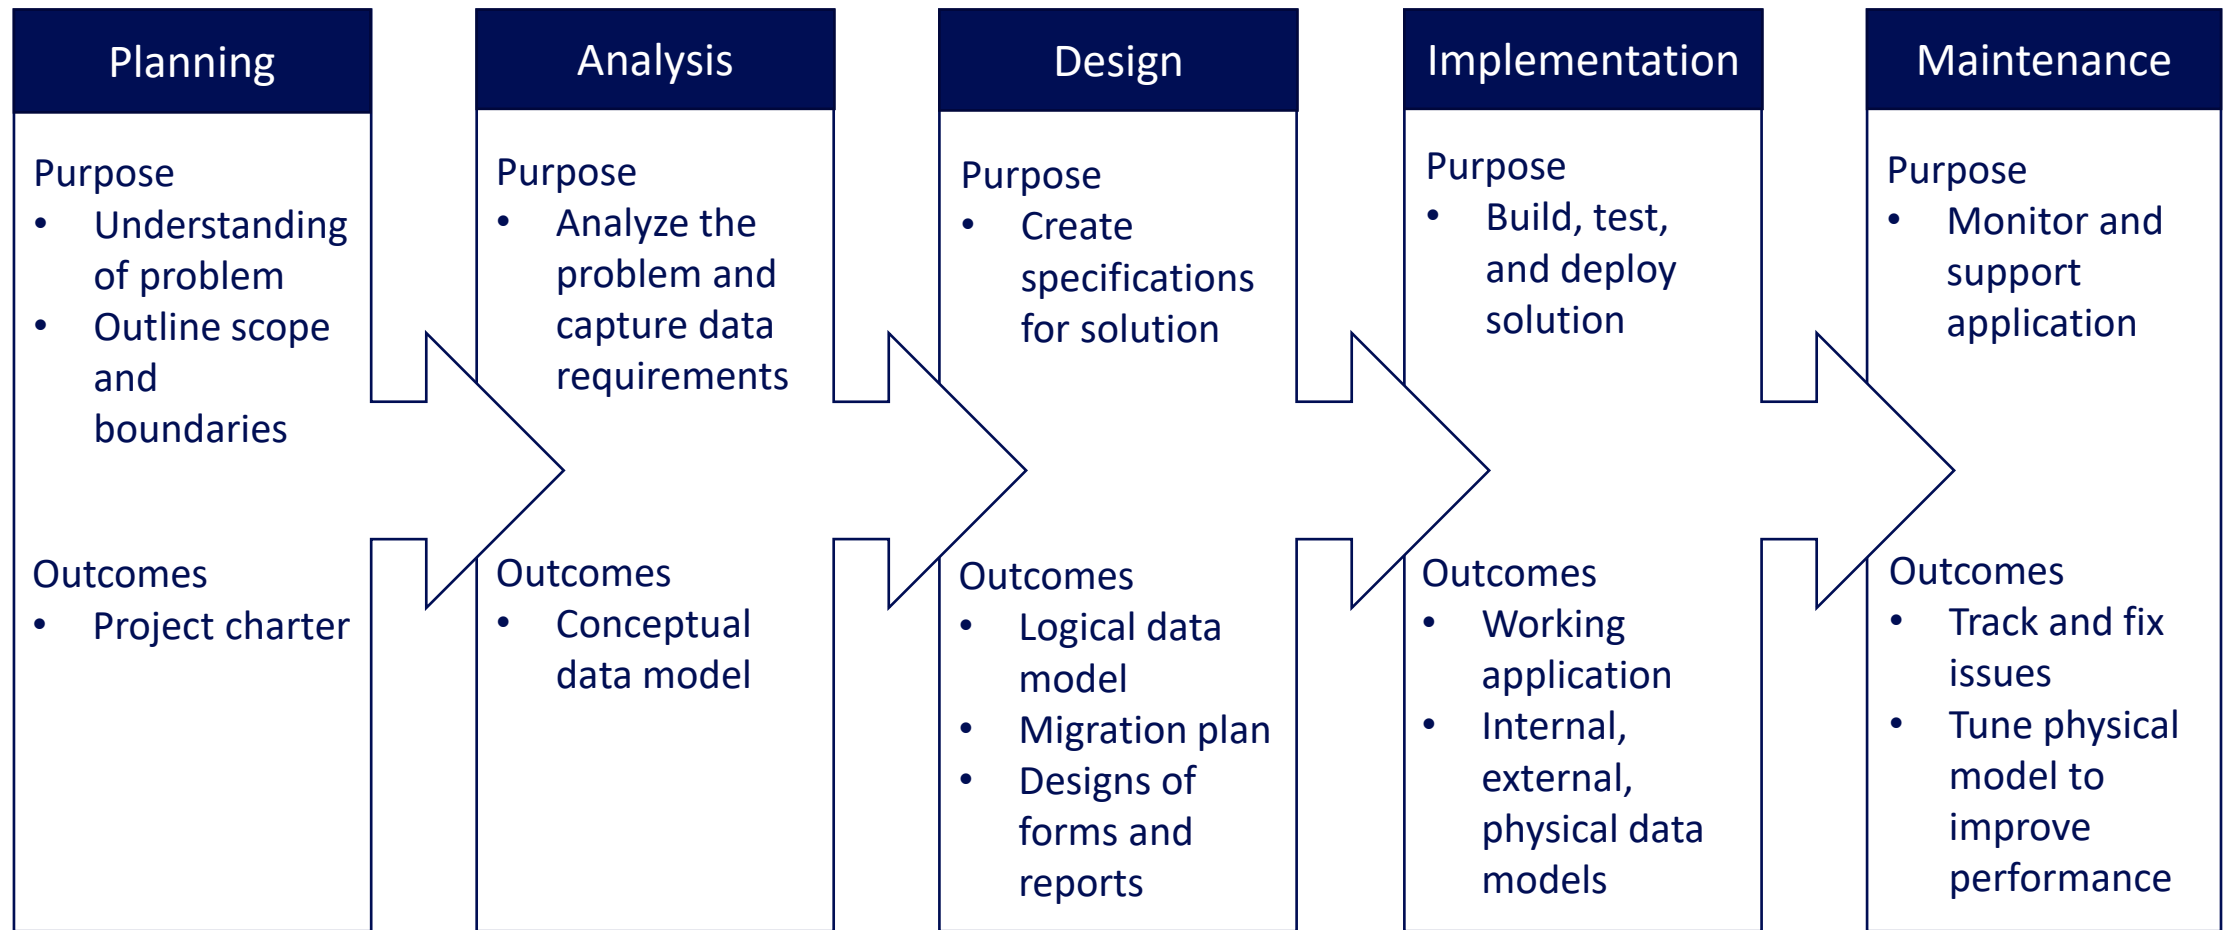

# Data Models, an Example

Conceptual	Logical	Internal	External	Physical
<u>Customer</u> Name Email Phone	<u>Customers</u> ID First Name Last Name Email Phone Created On Last Update	<pre>create table <u>customers</u> (   id int identity   primary key,   first_name varchar(50),   last_name varchar(50),   email varchar(100),   phone char(10),   created_on datetime,   last_update datetime )</pre>	<pre>create view v_customers as   select     first_name + ' '     last_name as name,     email,     phone   from <u>customers</u></pre>	<pre>create unique index   ix_customers_email   on <u>customers</u> (email)  create index on   ix_customers_name   on <u>customers</u> (     last_name, first_name   ) include (     email, phone   )</pre>

# Database Development Life Cycle

Database Application Development

The End

# Summary

# Summary

- Database is data plus metadata plus data management.
- Not all databases are computerized.
- A DBMS is software that helps to computerize databases.
- There are different implementation models of DBMS.
- Databases can be perceived at various levels, conceptually, logically, and as an implementation.
- These perceptions have their place in the database development life cycle.

Summary

The End
