

The Relational Model

Agenda

- What is the relational model? Why is it popular?
- What are the elements of the relational model?
- The relational model in a DBMS implementation
- Tables and relations
- Keys
- Data domains
- NULL and flags
- Referential integrity

Recall: Popular Implementation Models

| Name | Description | Use cases |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------|
| Relational | Data are stored in structured tables of rows with metadata defining the columns; metadata defines how data in tables connect to one another | Business applications, multiuse |
| Key value | Data are stored under a key; information can be retrieved by key; little to no metadata | Caching, session management, real-time data |
| Document | Structured metadata is stored with data in a document; like documents are stored in collections | Content management, master data, search engines |
| Graph | Data are structured into nodes, edges, and labels; permits for complex relationships among data | Hierarchical data, networked data, social networks |
| Column-oriented | Tabular data structure with data in columns and metadata in the row, a computationally efficient structure for data analytics | Internet of things data, data analytics, data warehousing |
| Time series | Tabular data structure in time-order; data are immutable and support high-volume writes | Internet of things, time-oriented analysis, and forecasting |

Why Is Relational So Popular?

- Data independence; how the data are stored is independent from how they are accessed
- Uses SQL: an easy-to-learn query language
- 50 years of existence means there are a lot of implementations

Components of the Relational Model

The Relational Model

The End

Tables and Relations

Tables

- Two-dimensional persistent data structures in the DBMS
- The table is a collection of items to be stored
- Each row is a distinct item, called a tuple
- Each column is a set of acceptable values, known as a data domain

| Electric cars | | | |
|---------------|----------|--------------|----------------|
| Make | Model | Retail price | Range in miles |
| Chevy | Bolt | \$36,620 | 259 |
| Nissan | Leaf | \$34,190 | 149 |
| Mini | Hardtop2 | \$29,900 | 110 |
| Hyundai | Ioniq | \$33,045 | 170 |

Relations

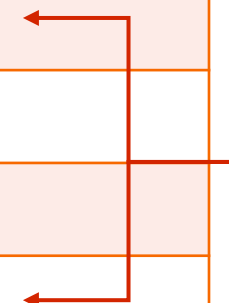

A table is a relation if the data in the row are unique.

This table is a relation.

| Electric cars | | | |
|---------------|----------|--------------|----------------|
| Make | Model | Retail price | Range in miles |
| Chevy | Bolt | \$36,620 | 259 |
| Nissan | Leaf | \$34,190 | 149 |
| Mini | Hardtop2 | \$29,900 | 110 |
| Hyundai | Ioniq | \$33,045 | 170 |

This table is not a relation.

| Electric cars | | | |
|---------------|----------|--------------|----------------|
| Make | Model | Retail price | Range in miles |
| Chevy | Bolt | \$36,620 | 259 |
| Nissan | Leaf | \$34,190 | 149 |
| Mini | Hardtop2 | \$29,900 | 110 |
| Hyundai | Ioniq | \$33,045 | 170 |
| Nissan | Leaf | \$34,190 | 149 |

Tables and Relations

The End

Primary Key Constraint and Entity Integrity

Primary Key Constraint and Entity Integrity

- Entity integrity is a characteristic of a table that ensures it will be a relation.
- We achieve entity integrity with a primary key constraint: a column or set of columns for which each value must be unique and present (NOT NULL).
- There can only be one primary key constraint per table in the DBMS implementation.

Primary Key Constraint
and Entity Integrity

The End

Demo

Tables and Entity Integrity

Demo: Tables and Entity Integrity

- We will use the Adminer web application.
- Let's create a courses table in the tinyu database.
- Create one column in the table called course_code.
- Add some courses to the course table.
- Edit a course.
- Add the same course, and it's no longer a relation.
- Use a primary key constraint to set entity integrity forcing it to be a relation.

Demo: Tables and Entity Integrity

The End

DRY and Entity Integrity

The DRY Rule of Table Design

Designing relational tables is easy!

- Each row represents a singular distinct entity.
- Each attribute in a column is data as fact—a single atomic value.
- No single entity spans more than one row.
- DRY stands for don't repeat yourself.

DRY and Entity Integrity

The End

Keys

Keys

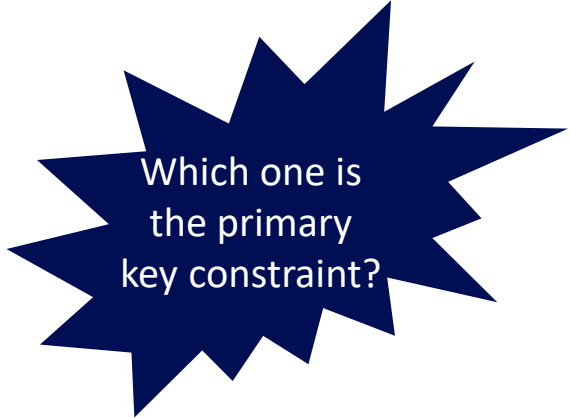

- A key is any value in a table that can be used to look up another set of values from the same table or another table.
- Any value can act as a key.
- Some keys are unique. These can be used for entity integrity.

Key Concepts

- Candidate key: any column or set of columns that make the table a relation
- Natural key: column values are unique across the entire data domain, ensures entity integrity (aka business key)
- Surrogate key: a system-generated unique value, such as an automatically incremented integer
- Secondary key: any column used to retrieve data from the table; need not be unique
- Composite key: any key consisting of more than one column; e.g., composite primary key or composite surrogate key

Example of Different Keys

| Students | | | | | |
|----------|-----------|----------|-------------------|-------|-----------|
| id | firstname | lastname | email | gpa | year |
| 1 | Robin | Banks | <u>rb@uni.edu</u> | 4.000 | Freshman |
| 2 | Victor | Edance | <u>ve@uni.edu</u> | 2.404 | Freshman |
| 3 | Erin | Yortires | <u>ey@uni.edu</u> | 2.401 | Junior |
| 4 | Aurora | Borealis | <u>ab@uni.edu</u> | 3.024 | Senior |
| 5 | Tuck | Androll | <u>ta@uni.edu</u> | 3.333 | Senior |
| 6 | Eura | Quittin | <u>eq@uni.edu</u> | 3.372 | Senior |
| 7 | Willie | Survive | <u>ws@uni.edu</u> | 2.608 | Sophomore |

Which one is
the primary
key constraint?

Surrogate
key

Composite
candidate key

Natural key
student email

Secondary key:
find seniors

Keys

The End

Surrogate Keys

Which Key Should Be the Primary Key?

- Natural keys are good choices.
- Surrogate keys are better because of how the DBMS physically stores data by primary key.

| user_email | user_name |
|--------------------------------|------------|
| <u>mmioff@g.co</u> <u>m</u> | Mary Mioff |
| | |
| | |
| user_id | user_name |
| 1 | Mary Mioff |
| | |
| | |

| user_email | user_name |
|--------------------------------|------------|
| <u>akuss@g.com</u> | Abby Kuss |
| <u>mmioff@g.co</u> <u>m</u> | Mary Mioff |
| | |
| user_id | user_name |
| 1 | Mary Mioff |
| 2 | Abby Kuss |
| | |

| user_email | user_name |
|--------------------------------|------------|
| <u>akuss@g.com</u> | Abby Kuss |
| <u>balott@g.com</u> | Bett Alott |
| <u>mmioff@g.co</u> <u>m</u> | Mary Mioff |
| user_id | user_name |
| 1 | Mary Mioff |
| 2 | Abby Kuss |
| 3 | Bett Alott |

Surrogate Keys

The End

Demo

Surrogate Keys

Demo: Surrogate Key

- We will use the Adminer web application.
- Let's alter the course table in the tinyu database.
- Add an ID column as a surrogate key.
- Add a course to the table.
- Alter the table and set the primary key to the surrogate key.
- Add the same course, and there's no problem. We will fix this later in the demo.

Demo: Surrogate Keys

The End

Data Domains

Data Domains

Physical domain: how data in the column are physically stored

Logical domain: acceptable values, implemented through data integrity constraints

Physical Domain: Data Types

| Data type | Used for storing data as | Examples |
|-----------|-----------------------------------------------|--------------------|
| Integer | Integer values | -100, 42, 0 |
| Decimal | Binary encoded decimal | 34.90, 12903.4827 |
| Float | Floating point numbers; mantissa and exponent | 6.02e23 1.00e3 |
| Char | Fixed length characters of the same size | "NY", "PA", "NJ" |
| Varchar | Varying length characters of a maximum size | "Mike", "Michael" |
| Date | Dates | 2020-12-25 |
| Time | Times | 8:15 PM |
| Datetime | Dates and times together | 2020-01-01 11:59AM |

Logical Domain: Data Integrity Constraints

- Unique constraint: functions like a primary key constraint but does not affect the physical order of the data in the table
- Check constraint: an expression that must be true prior to data being written to the database
- Default value constraint: a value used for a data attribute when one is not specified

Data Domains

The End

Demo

Data Domains

Demo: Data Domains

- We will use the Adminer web application.
- Let's alter the course table in the tinyu database.
- Add course_title, course_college, and course_credits columns.
- Add a unique constraint on the course_code column.
- Add a default constraint on the course_credits column to 3.
- Add a check constraint where the course credits must be greater than or equal to 0 and less than or equal to 6.
- Test out the constraints.

Demo: Data Domains

The End

NULL and Flags

NULL and Flags

- NULL is the absence of a value.
- NULL can be problematic in some text columns.
- In this case, we use a flag—a special attribute used in place of NULL.

| Employees | | | |
|-----------|---------------------|------------------|---------------|
| id | name | termination_date | benefits_plan |
| 101 | Willie Survive | | BluePoint |
| 102 | Curt Tens | Feb-14 2020 | |
| 103 | Sara Doctorintahaus | | OrangePoint |
| 104 | Dustin Dawind | | |

NULLS OK here

These are NULL for different reasons

| Employees | | | |
|-----------|---------------------|------------------|----------------|
| id | name | termination_date | benefits_plan |
| 101 | Willie Survive | | BluePoint |
| 102 | Curt Tens | Feb-14 2020 | N/A-Terminated |
| 103 | Sara Doctorintahaus | | OrangePoint |
| 104 | Dustin Dawind | | N/A-Opt-Out |

Flags provided

NULL and Flags

The End

Foreign Keys and Referential Integrity

Foreign Keys and Referential Integrity

- Referential integrity is a characteristic of a column in a table that ensures the values in that column are NULL or come from the values of a primary key column in another table.
- We achieve referential integrity in the DBMS with a foreign key constraint—a constraint on a column in one table which references a primary key column in another.
- There can be several foreign key columns within a table.
- The same primary key can be referenced by several foreign keys.

Example: Foreign Keys and Referential Integrity

Joining tables on PK-FK allows you to match rows in different tables.

| Employees | | | | |
|-----------|-------------|-----------|----------|-------------|
| id | Ssn | firstname | Lastname | hourly_rate |
| 13 | 695-25-9623 | Sonny | Dayz | \$ 19.66 |
| 33 | 093-29-8015 | Hugh | Japple | \$ 20.50 |
| 36 | 140-63-5030 | Ally | Gator | \$ 18.97 |
| 66 | 964-09-8650 | Aurora | Borealis | \$ 17.22 |

id column is set as the primary key constraint of the employees' table. This establishes entity integrity.

| Paychecks | | | | |
|-----------|-----------|-------------|-----------|-------------|
| id | payperiod | total_hours | gross_pay | employee_id |
| 7072 | 3/6/2020 | 18 | \$ 341.41 | 36 |
| 7097 | 3/6/2020 | 7 | \$ 137.65 | 13 |
| 7108 | 3/6/2020 | 15 | \$ 258.29 | 66 |
| 7132 | 3/6/2020 | 9 | \$ 184.51 | 33 |
| 7155 | 3/13/2020 | 4 | \$ 78.66 | 13 |
| 7169 | 3/13/2020 | 20 | \$ 344.38 | 66 |
| 7194 | 3/13/2020 | 13 | \$ 246.57 | 36 |
| 7196 | 3/13/2020 | 9 | \$ 184.51 | 33 |
| 7208 | 3/20/2020 | 4 | \$ 75.87 | 36 |
| 7251 | 3/20/2020 | 21 | \$ 361.60 | 66 |
| 7257 | 3/20/2020 | 20 | \$ 393.29 | 13 |
| 7258 | 3/20/2020 | 14 | \$ 287.01 | 33 |

employee_id column is set as the foreign key constraint for the employees' table. Referential integrity states these values must exist as primary keys in employees or be NULL.

Lookup Tables

- Using a foreign key to restrict a column to a set of values
- Lookup tables are used in the UI for choice selection

| Students | | | | |
|----------|-----------|----------|-------|--------------|
| id | firstname | lastname | gpa | student_year |
| 1 | Robin | Banks | 4.000 | Freshman |
| 2 | Victor | Edance | 2.404 | Freshman |
| 3 | Erin | Yortires | 2.401 | Junior |
| 4 | Aurora | Borealis | 3.024 | Senior |
| 5 | Tuck | Androll | 3.333 | Senior |
| 6 | Eura | Quittin | 3.372 | Senior |
| 7 | Willie | Survive | 2.608 | Sophomore |

Foreign
key

| year_name | sort_order |
| Freshman | 1 |
| Sophomore | 2 |
| Junior | 3 |
| Senior | 4 |

Primary key

Foreign Keys and Referential
Integrity

The End

Demo

Foreign Keys

Demo: Foreign Keys

- We will use the Adminer web application.
- Let's work with the tinyu database.
- Add a college_lookup table to restrict the course_college column in the course table.
- Add colleges to the college_lookup table.
- Demonstrate referential integrity through the foreign key constraint.

Demo: Foreign Keys

The End

Summary

Summary

- The DBMS table consists of rows and columns.
- It is best practice to have entity integrity on your tables via a primary key constraint.
- The best primary key is a surrogate key.
- Natural keys should have unique constraints set.
- Implement physical domain with data types.
- Implement logical domain through data integrity constraints.
- Use foreign key constraints to ensure referential integrity.

Summary

The End
